# New Conjugated Systems Derived from Piperazine-2,5-dione 

Abdullah Mohamed Asiri<br>Chemistry Department, Faculty of Science, King Abdulaziz University, Jeddah, Saudi Arabia

#### Abstract

The preparation of mono arylidene and both symmetrical and unsymmetrical bis-arylidene derivatives of piperazine- 2,5 -dione is described. The use of 1,4 diacetyl piperazine- 2,5 -dione make it possible to prepare unsymmetrical bis-arylidene. The introduction of Dicyanomethylene moiety in the para position of one of the arylidene groups gave remarkable deepening in the colour of the resulting compound 11.

## Introduction

The chemistry of piperazine-2,5-dione $\mathbf{1}$ is of great interest since many natural products possess its ring system ${ }^{[1-3]}$. Derivatives of 1 are useful in peptide synthesis ${ }^{[4]}$, in synthesis of pyrazines ${ }^{[5-6]}$, and in Diels-Alder reactions as $4 \pi$ components ${ }^{[7]}$. Recent study showed that 3 -salicylidene (piperazine-2,5-dione) 3 was supposed to be the most promising precursor for the synthesis of spiro[ben-zofuran-2(3H)3'-piperazine]-3',6'-dione as main skeleton of aspirochlorine ${ }^{[8-9]}$.

The structural similarity of derivative 3 to the chromophore of indigo 4, led us to assume that if the arylidene (piperazine-2,5-dione) could be obtained with donor-acceptor substituents, then merostabilization of the excited state ${ }^{[10]}$ should occur to give deeply coloured compounds that might be novel dyestuffs. This paper deals with the synthesis of mono and bis-arylidene derivatives possessing donor and acceptors substituents.

## Results and Discussion

Piperazine-2,5-dione 1 was prepared by self-condensation of glycine according to the literature method ${ }^{[4]}$. 1,4-diacetylpiperazine-2,5-dione 2 was prepared by treating compound $\mathbf{1}$ with acetyl chloride at room temperature ${ }^{[11]}$.

## Symmetrical Bis-arylidene Derivatives

Condensation of compound $\mathbf{1}$ with two equivalents of thiophene-3-carboxaldehyde and indole-3-carboxaldehyde afforded the corresponding bisarylidenes $\mathbf{5}$ and $\mathbf{6}$ respectively.

Compound 5 showed an NH absorption at $3266 \mathrm{~cm}^{-1}$, a band at $1683 \mathrm{~cm}^{-1}$ for the carbonyl group and $1625 \mathrm{~cm}^{-1}$ for $\mathrm{C}=\mathrm{C}$ (See Table 2).

5 ; Ar=3-thienyl
6; $\mathrm{Ar}=3$-indolyl

7; $\mathrm{Ar}=3-\mathrm{C}_{4} \mathrm{H}_{3} \mathrm{~S}$

## Mono Arylidene and Unsymmetrical Bis-arylidene Derivatives

Condensation of piperazine-2,5-dione 1 with aromatic aldehyde always afforded symmetrical bis-arylidene derivative. However condensation using 1,4-diacetylpiperazine-2,5-dione $\mathbf{5}$ with aldehydes could be controlled to occur stepwise. Two novel monoarylidene $\mathbf{7}$ and $\mathbf{8}$ were synthesized from the reaction of equal molar quantity of $\mathbf{2}$ and the appropriate aldehyde.

The $\mathrm{H}^{1}$-NMR spectrum of compound 7 showed a singlet at $\delta 4.5 \mathrm{ppm}$ attributed to the methylene signal indicative of mono arylidene derivative. Its ir spectrum showed an NH absorption band at $3255 \mathrm{~cm}^{-1}$ and broad bands at 1693 $\mathrm{cm}^{-1}$ and $1661 \mathrm{~cm}^{-1}$ for the two $\mathrm{C}=\mathrm{O}$ groups.

The unsymmetrical diaryldene derivatives were prepared from the mono arylidene derivatives 7 and $\mathbf{8}$ as shown in Scheme 1.

7

14

Scheme 1
Compound $\mathbf{1 0}$ was synthesized by condensing one equivalent of compound 7 with the equivalent amount of terphthaldehyde in dimethylformamide at room temperature. Its ir spectrum showed an absorption band at $1705 \mathrm{~cm}^{-1}$ for the aldehydic $\mathrm{C}=\mathrm{O}$ group of the free aldehyde. Compound $\mathbf{1 0}$ was readily undergo knovenagel condensation with active methylene compounds readily. Thus the treatment of the aldehyde derivative $\mathbf{1 0}$ with malononitrile using piperidene as a base to afford the red dicyanomethylene adduct $\mathbf{1 1}$ in good yield (Scheme 1). The ir spectrum of the later showed a CN absorption band at $2197 \mathrm{~cm}^{-1}$. The introduction of the powerful electron withdrawing group $\mathrm{CH}=\mathrm{C}(\mathrm{CN})_{2}$ into the para position of the phenyl group in compound $\mathbf{1 1}$ gave a remarkable deepening in colour when compared with the yellow compound $\mathbf{1 0}$. This deepening in colour is believed to be due to the stabilization of half of the molecule brought about by the hybrid resonance $\mathbf{1 2}$ (Scheme 2).

Scheme 2

To get a clear insight of this colour change we synthesized two other bis arylidene derivatives $\mathbf{1 3}$ and $\mathbf{1 4}$ which both contains a donor group on one arylidene and an acceptor on the other one. Compound 14 was prepared from the mono arylidene 7 and phthalic anhydride in good yield. The formation of the 1,3-dione derivative 14 is believed to be via the intermediate $\mathbf{1 5}$. The structure of compound 14 was followed from its ir spectrum which showed an absorption for the carbonyl groups of the 1,3 -diketone moiety at $1670 \mathrm{~cm}^{-1}$ which expected to appear at wavenumber greater than $1750 \mathrm{~cm}^{-1}$ for compound 15.

13

## Experimental

Melting points were recorded on a Thomas-Hoover capillary melting apparatus without correction. IR spectra were taken as KBr disk on a Nicolet Magna 520 FT IR spectrometer, ${ }^{1} \mathrm{H}$ NMR were recorded solution in $\mathrm{CDCl}_{3}$ on a Brucker DPX 400 MHz spectrometer using TMS as internal standard. Microanlyses were carried out using a Perkin Elmer 240B Analyzer.

The following compound were prepared by the literature methods reported previously: Piperazine-2,5-dione 1, m.p. $>300^{\circ} \mathrm{C}$ [lit. ${ }^{[4]} \mathrm{m}$. p. $\left.>300^{\circ} \mathrm{C}\right] ; 1,4-$ diacetylpiperazine-2,5-dione 2, m.p. $98-100^{\circ} \mathrm{C}\left[\right.$ lit. ${ }^{[11]}$ m.p. $\left.99-100.5^{\circ} \mathrm{C}\right]$.

## 3,6-di(3-thienylidene) piperazine-2,5-dione 5 and 3,6-di(3-indolylidene) pi-perazine-2,5-dione 6

A mixture of piperazine-2,5-dione 1 ( 0.01 ), the appropriate aldehyde ( 0.02 $\mathrm{mol})$ and anhydrous acetate ( 0.04 mole ) in acetic anhydride ( 15 ml ) was refluxed for 5 hours. The mixture was cooled and washed with water, filter and washed with small amount of ether (see Tables $1 \& 2$ ).

## 1-Acetyl-3-(3-thienylidene) piperazine-2,5-dione 7 and 1-acetyl-3-(4-dimethyl aminobenzylidene) piperazine-2,5-dione 8

A mixture of 1,4-diacetylpiperazine-2,5-dione $2(0.01 \mathrm{~mol})$, the appropriate aldehyde ( 0.01 mole ) and triethylamine ( 0.01 mole ) was stirred at room tem-
perature for 12 hr . The resulting precipitate was filtered off and washed with water. Recrystallization from ethanol gave the pure monosubstituted derivatives 7 and 8 (see Tables $1 \& 2$ ).

## General procedure for the preparation of unsymmetrical bis-arylidenes

3-(3-thienylmethylidene)-6-(4-Dimethylaminobenzylidene) piperazine-2,5-dione 9, 3-(3-thienylmethylidene)-6-(4-formylbenzylidene) piperazine-2,5-dione 10, and 3-(3-thienylmethylidene)-6-(1,3-dioxo-2-indanylidene) piperazine-2,5dione 14

A solution of 1-acetyl-3-(3-thienylmethylidene) piperazine-2,5-dione 7 (0.01 mole), aldehyde ( 0.01 moles) and triethylamine ( 0.01 mole ) in 25 ml of dimethylformamide was stirred at $25^{\circ} \mathrm{C}$ for 12 hr . The precipitate was filtered and washed with water and small amount of cooled ethanol ( 10 ml ). The pure samples were obtained after recrystallization from dimethylformamide (see Tables $1 \& 2$ ).

```
3-(4-Dimethylaminobenzylidene)-6-(4-nitrobenzylidene) piperazine-2,5-
dione 13
```

This compound was prepared from 1-acetyl-3-(4-dimethylaminobenzy-lidene)-piperazine2,5-dione 8 (1.0 mmole) and 4-nitrobenzaldehyde (1.0 mmole) using the same general procedure mentioned above (see Tables $1 \& 2$ ).

## 3-(3-thienylmethylidene)-6-[4-(1,1-dicyanovinyl) benzylidene] piperazine-2,5-dione 11

Piperidine was added dropwise to a warm solution of the aldehyde $10(0.5 \mathrm{~g}$, $1.5 \mathrm{mmole})$ and malononitrile ( $0.1 \mathrm{~g}, 1.5 \mathrm{mmole}$ ) in ethanol ( 20 ml ). A deepening in the colour of the solution was observed. The reaction mixture was refluxed for 3 hr , then cooled. A dark red solid was precipitated, filtered, and washed with cold ethanol and dried (see Tables $1 \& 2$ ).
